Hi Dennis:

I hope you are well! I am FINALLY revisiting this project!

Three quick questions...
1. Do your servers include SSH access, or is it FTP only?
2. Can I install and use WP-CLI on the server?
3. Can I set up custom server-level cron jobs (not WordPress wp-cron)?

Thank you,

Lou

Hi Louis:

Yes to all, however, if you do any of these things yourself, I have no ability to assist when things go off the rails or if you accidentally trash something.

You only have your Updraft Plus backups to rely on at this point.

If, in SSH, you make a fatal mistake, I may have no ability to help you recover.

You may lose all your data, all your files, etc. and the only thing I could do would be to completely rebuild your server from scratch; and then you would need to restore your sites from whatever backups you have on your local computer storage.

WP-CLI is used in the SSH terminal it pretty much provides the same facilities as you already have in the WordPress admin area; the difference is, with WP-CLI you are working in a very dangerous area where you can completely trash WordPress.

If you need server-level CRON jobs added, I can add them for you, or if you need to disable the WordPress CRON and have WordPress use the server-level CRON service, I can make this change for you.

Be aware, when you do this, WordPress will tell you “The DISABLE_WP_CRON constant is set to true. WP-Cron spawning is disabled.”

If you have a CRON job you want added to the server, email the CRON command and I’ll make this change for you.

All these facilities can be accessed in your server cPanel > Tools > Terminal when you log in as your root user.

WARNING: If you use these tools or use the SSH terminal to perform changes, I have no ability to assist except to completely rebuild your server, causing you to lose all files and data.

Best Regards,

Dennis Hall

Dennis:

Thank you for the prompt reply and detail. I will consider all.

Have a great rest of the weekend!

Hi Dennis:

When you have a chance, can you please provide:

1. SSH credentials for the server (194.233.102.135) — username and password or key
2. PHP upgrade from 7.4.33 to 8.1+ (current version is end-of-life, blocking LearnDash updates)
3. Confirm: is the main site at /var/www/html/techcelerate-ce.com/ the same server/WordPress install, or separate?

Planning to do a lot of work on the site this week.

As always, thank you for your help!

Lou

Hi Louis:

Your cPanel credentials are you SSH credentials.

That's how come you can access the terminal form with in the cPanel.

I'll be happy to get you set up with PHP8.3-fpm (8.1 is also old).

I'm currently doing the upgrade for you and need to reboot the server right now to continue.

Hi again Louis:

To answer your question, no, both sites are separate WordPress installs, each having their own WordPress debug log files.

Best Regards,

Dennis Hall

Hi Louis:

I'm upgrading your server to a newer firmware version while at it, so this will take about 30 more minutes and I'll be rebooting another time during this process.

I should be done by 9:30PM.

Best Regards,

Dennis Hall

Hi Louis:

Done, both your sites are now running on PHP8.3-fpm.

Have a nice night, I'm shutting down now.

Best Regards,

Dennis Hall
